(57) Abstract :

The invention describes a device designed for the treatment of the external male genitalia hipoplasia, creating a growth of tissues and a correction of existing curvatures. The invention's device is unique for using an external genitalia fixation(1;13) associated to a dynamometric system (5) and to a gland protection system(15). The system of external genitalia inferior fixation(1) and superior (13) produces on the male genitalia a traction force. The gland protection system (5) creates on the male genitalia a tissue expansion. The gland protection system(15) avoids possible cuts, this allows a long term use of the device, free of discomfort. The device's user can wear it for many months, during a few hours a day. This way, the chance of a tissue expansion plus an elongated expansion in time are fundamental for the external male genitalia hipoplasia treatment.
